KitaabKosh Documentation

KitaabKosh is a book management system designed to help users organize, track, and manage books for libraries or personal collections. The system allows users to upload book details, manage availability, and maintain a digital catalog. The project is user-friendly and suitable for all types of users.

Table of Contents

- Features

Features

- User authentication and account management
- Upload and manage book records (title, author, description, file, public/private)
- Search and list all public books or your personal book collection
- RESTful API with OpenAPI/Swagger documentation

Usage Instructions

1. **Client Setup**
    - Install dependencies in the `client` directory (uses React, Tailwind CSS, etc.)
    - Run the client with your preferred package manager (`npm run dev` or similar)
    - Main entry point: `client/src/main.jsx`
    - The client routes include Home, Dashboard, About, and Contact.
2. **Server Setup**
    - Install dependencies in the `server` directory (Express, Prisma, etc.)
    - Configure environment variables for database and Cloudinary.
    - Run the server (`node server/src/index.js` or with your preferred process manager)
    - The server exposes API endpoints for authentication and book management.
    - API Reference is available at `/api-reference` and `/openapi.json` (Swagger).
3. **Database and Seeding**
    - Uses Prisma for ORM.
    - Seed script: `server/prisma/seed.js` populates the database with test users and books.

API Documentation

The API follows RESTful principles and is documented using OpenAPI 3.0.
Main endpoints:

- `POST /api/auth/signin` - User login
- `GET /api/books/public` - List all public books
- `GET /api/books/my-books` - List books for the authenticated user
- `POST /api/books` - Create a new book (multipart form: title, author, description, file, isPublic)
- `GET /api/books/{id}` - Get book details by ID
- `PUT /api/books/{id}` - Update a book
- `DELETE /api/books/{id}` - Delete a book

Authentication uses Bearer tokens (JWT).

View the full OpenAPI specification by running the server and visiting `/api-reference` or `/openapi.json`.

File Listing and Purposes

> This list may be incomplete. Browse all files on GitHub

Client

- `client/src/main.jsx`

Main React entry point, sets up routes and authentication context.

- `client/src/routes/home.jsx`
  Home page, displays the sign-up form.
- `client/src/routes/about.jsx`
  About page, describes the project and its goals.
- `client/src/lib/queries.js`
  Contains API query functions for books and authentication (get public books, get my books, create/update/delete book, sign-in).
- `client/index.html`
  HTML template loaded by the React app.
- `client/src/app.css`
  Tailwind CSS configuration and custom styles.
- `client/src/lib/utils.js`
  Utility functions for class name merging (cn, clsx, twMerge).
- `client/.prettierrc`
  Prettier configuration for code formatting.
- `client/eslint.config.js`
  ESLint configuration for JavaScript/React.

Server

- `server/src/index.js`
  Main Express server file; sets up routes, CORS, API reference, and starts the server.
- `server/src/routes/books.js`
  Book-related API endpoints (create, list, update, delete, get book by ID).
- `server/src/controllers/user.js`
  User controller logic, including registration, file upload to Cloudinary, error handling.
- `server/src/utils/cloudinary.js`
  Utility for uploading files to Cloudinary.
- `server/prisma/seed.js`
  Script to seed the database with sample users and books.
- `server/public/temp/TempStorage`
  Directory for temporary storage of uploaded PDF books.

Team

The project was created by a group of four students.
See the About page or GitHub repo for the full team list.
